

Customer Advisory: MinIO Image Removal from Quay Registry

Overview

IBM has identified an issue affecting **IBM Storage Fusion Backup and Restore** deployments that depend on a MinIO container image previously hosted on the public Quay registry. The image has been removed by MinIO and is no longer available for download.

As a result, environments that attempt to pull the image from Quay may experience installation, upgrade, and runtime failures.

Problem Details

When the MinIO image cannot be retrieved, the **guardian-minio** pod will fail to start. The message in the pod event will contain:

```
Failed to pull image
"quay.io/minio/minio@sha256:14cea493d9a34af32f524e538b8346cf79f3321eff8e708c1e2960462bd8936e": initializing source
docker://quay.io/minio/minio@sha256:14cea493d9a34af32f524e538b8346cf79f3321eff8e708c1e2960462bd8936e: reading
manifest sha256:14cea493d9a34af32f524e538b8346cf79f3321eff8e708c1e2960462bd8936e in quay.io/minio/minio:
unauthorized: access to the requested resource is not authorized
```

This error indicates that the required image is no longer accessible from the Quay registry.

Impact Assessment

This issue does **not** affect existing air-gapped environments where the MinIO image has already been mirrored into a local registry and remains available to the cluster.

However, customers using connected environments may experience the following impacts across all IBM Storage Fusion releases:

1. Installation and Upgrade Failures

New installations and upgrade operations may fail because the required MinIO image can no longer be pulled from the public Quay registry.

2. Transaction Manager Service Disruption

If the Transaction Manager pod is restarted or rescheduled to a node where the image is not already cached, the pod may fail to start.

3. Backup and Restore Operation Failures

Backup and restore jobs may fail when scheduled on nodes that do not have the required MinIO image available locally.

Affected Versions

If the customer is using Backup and Restore function, this issue affects **all IBM Storage Fusion releases**.

Resolution

To resolve this issue, download and apply the **ImageDigestMirrorSet (IDMS)** YAML:

<https://github.com/IBM/storage-fusion/tree/master/backup-restore/hotfixes/minio/minio-idms.yaml>

The manifest creates a new image mirror configuration that redirects image pulls to a supported image source.

After applying the YAML, verify that the ImageDigestMirrorSet has been successfully created and allow sufficient time for the cluster image configuration to propagate across all nodes.
