

Customer Advisory: OADP 1.4.11 Certificate Handling Issue Impacting Backup and Restore Operations

Overview

IBM has identified an issue in **OpenShift API for Data Protection (OADP) 1.4.11** related to certificate handling. This issue can cause backup and restore operations in **IBM Storage Fusion** to fail.

OADP 1.4.x is supported on **OpenShift Container Platform (OCP) 4.18.x and earlier releases**. This issue does not impact if the customer is using OCP 4.19 and later.

Problem Details

Due to a certificate handling defect in OADP 1.4.11, backup operations may fail unexpectedly. Affected environments may observe backup or restore jobs entering a failed state with errors similar to the following:

Failed validation BMYBR0009

There was an error when processing the job in the Transaction Manager service. The underlying error was: Unexpected failure: "Velero BackupStorageLocation isf-aws-20260921-185853 could not be imported: FailedValidationException('Velero BackupStorageLocation 7d37a2a7-7841-4a30-a076-25d3fced2be1 is still Unavailable after 5 minutes')".

Impacted Releases

IBM Storage Fusion 2.14.0

The issue impacts **IBM Storage Fusion 2.14.0** only when the **In-Place Snapshot** feature is being used.

Other IBM Storage Fusion Releases

The issue affects all supported IBM Storage Fusion releases **except**:

- IBM Storage Fusion 2.12.4 (September Monthly Release)
- IBM Storage Fusion 2.13.2 (September Monthly Release)
- Future monthly releases will include this fix.

Resolution

IBM has released a hotfix to address this issue.

The hotfix can be downloaded from:

https://github.com/IBM/storage-fusion/tree/master/backup-restore/hotfixes/oadp_1.4.11/br-oadp-1.4.11-patch.sh

Upgrade Considerations

Before fixing the issue, if the customer upgraded to a Fusion version which has a fix already like 2.13.2, Fusion upgrade will be successful but Backup and Restore service will remain on the previous version. To complete the upgrade, customer must run the script.
